## Breast Care Pathway for Diagnostic Tests (2WW)

You will be referred onto 2WW pathway by your GP (or within King's).

You will be seen in a one stop clinic by a consultant breast surgeon or a member of their team.

A member of the medical team (consultant, clinical fellow, registrar or foundation year doctor) will take your medical history and complete a clinical examination.

You will be sent for a mammogram, and/or tomosynthesis, and/or ultrasound, and/or biopsy (usually decided by consultant radiologist - for example, some patients will only need a mammogram while others will need a mammogram and ultrasound).

All diagnostic tests are usually performed on the same day, but at times may need to be booked for another day.

The consultant radiologist will review your mammogram, tomosynthesis, ultrasound and/or biopsy as required.

If your breast or radiology consultant is concerned by the findings of the diagnostic tests and a biopsy is taken, this will be discussed with you. If you then have any further concerns, a breast clinical nurse specialist (CNS) can talk you through the next steps.

If your consultant is not concerned by findings on the diagnostic tests, but you have had a biopsy, you will be given an appointment for the biopsy results the following week and discharged.

You will be asked to return to the clinic in approximately one to two weeks for the results of your biopsy.

Your case will be discussed at a multidisciplinary meeting and a biopsy results report will be confirmed.

Your multidisciplinary team will decide on a treatment plan, further investigations or next steps

Cancer diagnosis is confirmed

No cancer is suspected

You will attend a results clinic with your consultant surgeon and breast CNS (as per national guidance) and given your cancer diagnosis.

You will be discharged back to the community.
